要約問題～オリジナル練習②

In an effort to reduce carbon emissions and promote sustainable energy, the government introduced a policy encouraging the use of electric cars. This policy includes financial incentives such as tax breaks and subsidies for both manufacturers and buyers of electric vehicles. As a result, the sales of electric cars have significantly increased in recent years, making them more common on the roads.

Supporters of this policy argue that it helps reduce pollution and combat climate change. By encouraging the use of electric cars, which do not produce emissions, the government is taking a big step toward a cleaner environment. Moreover, they believe that the financial incentives make it easier for people to afford these environmentally friendly vehicles, which contributes to the policy's success.

However, critics point out several issues with this policy. First, they argue that electric cars are still expensive for many people, even with the financial help. As a result, only wealthier individuals can afford them. Second, they highlight that the electricity used to charge these cars often comes from non-renewable energy sources like coal or natural gas, which still contributes to pollution. Critics believe that the policy does not address these concerns adequately and needs further improvements.
